

Sentiment Analysis Project Summary

Overview

This project analyzes customer reviews using basic Natural Language Processing techniques. The dataset was preprocessed and sentiment was calculated using polarity scores, which classify reviews as Positive, Negative, or Neutral. Visualizations such as bar charts, pie charts, and histograms were used to understand the distribution of sentiments and polarity values.

Key Findings

- Approximately 88% of the reviews are positive, showing high customer satisfaction.
- Around 10% of reviews are negative, highlighting recurring issues.
- Common complaints include poor product quality, stale items, wrong deliveries, and stock availability problems.
- Polarity distribution indicates that most feedback leans strongly toward the positive side.
- Some reviews show mismatches between ratings and written sentiment.

Recommendation

To improve overall customer experience, the business should focus on enhancing product quality, ensuring accurate and timely deliveries, and improving inventory management. Addressing these issues can help reduce negative reviews and further increase customer satisfaction.
